

A Brief Description Of How I interacted with the AI in completion of both Part A nd B

I used ChatGPT and DeepSeek as a learning tool to help me understand concepts and debug my code.

My interaction followed this pattern:

1. Conceptual clarification: I asked for explanations of key search algorithm concepts (admissibility, consistency, Manhattan distance, terrain costs, heuristic functions) to build my understanding before coding.

2. Code verification: I wrote my own implementations for each TODO (WeightedGridProblem, heuristic functions, BestFirstSearch, Greedy, A*, Weighted A*, IDA*) and asked the AI to verify correctness, identify syntax errors, and explain why certain approaches worked or failed.

3. Debugging assistance: When I encountered errors (indentation issues, Node object unpacking errors, `solution="child"` string vs Node object, missing terrain costs), I shared the error messages and my code, and the AI guided me toward fixes without giving the exact solution.

4. Reflection answers: I wrote my own answers to the reflection questions, and the AI verified them, pointed out inaccuracies and I revised my answers.

The AI assisted with explanation and debugging, but the final code and written answers are my own work. All algorithms were implemented by me based on my understanding of the pseudocode and lecture concepts.

Some Excerpts Are Below.

```
What does this mean? File
"/tmp/ipykernel_13238/1704187301.py", line 127
)
^
SyntaxError: expected ':'
```

That error means Python found a `)` where it was expecting a colon `:`.

The important part is:

```
File "/tmp/ipykernel_13238/1704187301.py", line 127
)
^
SyntaxError: expected ':'
```

The `^` points to the location where Python `↓`lly realized something was wrong, but the actual mistake is usually on the line **just before** it.

Summary of fixes:

Question	Your answer	Status
1	Correct	✓
2	Correct	✓
3	Correct	✓

GIVE A SIMPLE STARIGHT TO THE POINT AND EASY TO UNDERSTAND ANSWER.WHAT DOES MANHATTAN DISTANCE MEAN

Manhattan distance is the number of steps you need to move from point A to point B if you can only go **left, right, up, or down** (no diagonal shortcuts).
